

CASCADABLE FILE JACKETS

ABSTRACT

A cascadable file jacket includes a flexible substrate defined by a first and second surface. The cascadable file jacket further includes a file pocket position adjacent to the first surface, the file pocket constructed from a first ply that is folded to connect to a second ply and form an interior pocket. The first ply is folded to include a first tab adapted to fixedly engage the file pocket to the second surface. The second ply is folded to include a second tab adapted to expandably engage the file pocket to the second surface.
